1 Theory of Agents and Messages for Security Protocols 12
1.0.1 Inductive Definition of All Parts" of a Message 13
1.0.2 Inverse of keys 13
1.1 keysFor operator 13
1.2 Inductive relation "parts" 14
1.2.1 Unions 15
1.2.2 Idempotence and transitivity 15
1.2.3 Rewrite rules for pulling out atomic messages 16
1.3 Inductive relation "analz" 17
1.3.1 General equational properties 17
1.3.2 Rewrite rules for pulling out atomic messages 18
1.3.3 Idempotence and transitivity 19
1.4 Inductive relation "synth" 20
1.4.1 Unions 21
1.4.2 Idempotence and transitivity 21
1.4.3 Combinations of parts, analz and synth 22
1.4.4 For reasoning about the Fake rule in traces 22
1.5 HPair: a combination of Hash and MPair 23
1.5.1 Freeness 23
1.5.2 Specialized laws, proved in terms of those for Hash and MPair 24
1.6 Tactics useful for many protocol proofs 24

2 Theory of Events for Security Protocols 25
2.1 Function *knows* 26
2.2 Knowledge of Agents 27
2.2.1 Useful for case analysis on whether a hash is a spoof or not 29
2.3 Asymmetric Keys 29
2.4 Basic properties of *pubK* and *λA. invKey (pubK A)* 30
2.5 "Image" equations that hold for injective functions 31
2.6 Symmetric Keys 31
2.7 Initial States of Agents 33
2.8 Function *knows Spy* 34
2.9 Fresh Nonces 35
2.10 Supply fresh nonces for possibility theorems 35
2.11 Specialized Rewriting for Theorems About *analz* and Image . . . 35
2.12 Specialized Methods for Possibility Theorems 36

3 Needham-Schroeder Shared-Key Protocol and the Issues Property **36**
3.1 Inductive proofs about *ns_shared* . . . 37
3.1.1 Forwarding lemmas, to aid simplification . . . 37
3.1.2 Lemmas concerning the form of items passed in messages 38
3.1.3 Session keys are not used to encrypt other session keys . . 39
3.1.4 The session key K uniquely identifies the message . . . 39
3.1.5 Crucial secrecy property: Spy doesn't see the keys sent in NS2 . . . 39
3.2 Guarantees available at various stages of protocol . . . 40
3.3 Lemmas for reasoning about predicate "Issues" . . . 41
3.4 Guarantees of non-injective agreement on the session key, and of key distribution. They also express forms of freshness of certain messages, namely that agents were alive after something happened. 41

4 The Kerberos Protocol, BAN Version **42**
4.1 Lemmas for reasoning about predicate "Issues" . . . 45
4.2 Lemmas concerning the form of items passed in messages . . . 46
4.3 Non-temporal guarantees, explicitly relying on non-occurrence of oops events - refined below by temporal guarantees . . . 48
4.4 Temporal guarantees, relying on a temporal check that insures that no oops event occurred. These are available in the sense of goal availability . . . 50
4.5 Treatment of the key distribution goal using trace inspection. All guarantees are in non-temporal form, hence non available, though their temporal form is trivial to derive. These guarantees also convey a stronger form of authentication - non-injective agreement on the session key . . . 51

5 The Kerberos Protocol, BAN Version, with Gets event **52**
5.1 Lemmas concerning the form of items passed in messages . . . 56
5.2 Non-temporal guarantees, explicitly relying on non-occurrence of oops events - refined below by temporal guarantees . . . 58
5.3 Temporal guarantees, relying on a temporal check that insures that no oops event occurred. These are available in the sense of goal availability . . . 60
5.4 Combined guarantees of key distribution and non-injective agreement on the session keys . . . 61

6 The Kerberos Protocol, Version IV **62**
6.1 Lemmas about lists, for reasoning about Issues . . . 66
6.2 Lemmas about *authKeys* . . . 66
6.3 Forwarding Lemmas . . . 67
6.4 Lemmas for reasoning about predicate "before" . . . 68
6.5 Regularity Lemmas . . . 69
6.6 Authenticity theorems: confirm origin of sensitive messages . . . 71
6.7 Reliability: friendly agents send something if something else happened . . . 73
6.8 Unicity Theorems . . . 74
6.9 Lemmas About the Predicate *AKcryptSK* . . . 75

6.10 Secrecy Theorems . . . 77
6.11 Parties authentication: each party verifies "the identity of another party who generated some data" (quoted from Neuman and Ts'o). . . . 80
6.12 Key distribution guarantees An agent knows a session key if he used it to issue a cipher. These guarantees also convey a stronger form of authentication - non-injective agreement on the session key 82

7 The Kerberos Protocol, Version IV 85
7.1 Lemmas about reception event . . . 89
7.2 Lemmas about `authKeys` . . . 90
7.3 Forwarding Lemmas . . . 90
7.4 Regularity Lemmas . . . 91
7.5 Authenticity theorems: confirm origin of sensitive messages . . . 93
7.6 Reliability: friendly agents send something if something else happened . . . 95
7.7 Unicity Theorems . . . 97
7.8 Lemmas About the Predicate `AKcryptSK` . . . 97
7.9 Secrecy Theorems . . . 99
7.10 2. Parties' strong authentication: non-injective agreement on the session key. The same guarantees also express key distribution, hence their names . . . 103

8 The Kerberos Protocol, Version V 105
8.1 Lemmas about lists, for reasoning about Issues . . . 109
8.2 Lemmas about `authKeys` . . . 109
8.3 Forwarding Lemmas . . . 110
8.4 Regularity Lemmas . . . 111
8.5 Authenticity theorems: confirm origin of sensitive messages . . . 112
8.6 Reliability: friendly agents send somthing if something else happened . . . 114
8.7 Unicity Theorems . . . 115
8.8 Lemmas About the Predicate `AKcryptSK` . . . 116
8.9 Secrecy Theorems . . . 118
8.10 Parties authentication: each party verifies "the identity of another party who generated some data" (quoted from Neuman and Ts'o). . . . 121
8.11 Parties' knowledge of session keys. An agent knows a session key if he used it to issue a cipher. These guarantees can be interpreted both in terms of key distribution and of non-injective agreement on the session key. . . . 122
8.12 Novel guarantees, never studied before. Because honest agents always say the right timestamp in authenticators, we can prove unicity guarantees based exactly on timestamps. Classical unicity guarantees are based on nonces. Of course assuming the agent to be different from the Spy, rather than not in bad, would suffice below. Similar guarantees must also hold of Kerberos IV. . . . 124

9 The Original Otway-Rees Protocol **126**
9.1 Towards Secrecy: Proofs Involving `analz` . . . 128
9.2 Authenticity properties relating to NA . . . 128
9.3 Authenticity properties relating to NB . . . 130

10 The Otway-Rees Protocol as Modified by Abadi and Needham **132**
10.1 Proofs involving analz . . . 134
10.2 Authenticity properties relating to NA . . . 135
10.3 Authenticity properties relating to NB . . . 136

11 The Otway-Rees Protocol: The Faulty BAN Version **137**
11.1 For reasoning about the encrypted portion of messages . . . 138
11.2 Proofs involving analz . . . 139
11.3 Attempting to prove stronger properties . . . 140

12 Bella's version of the Otway-Rees protocol **141**
12.1 Proofs involving analz . . . 143

13 The Woo-Lam Protocol **146**

14 The Otway-Bull Recursive Authentication Protocol **149**

15 The Yahalom Protocol **154**
15.1 Regularity Lemmas for Yahalom . . . 156
15.2 Secrecy Theorems . . . 157
15.2.1 Security Guarantee for A upon receiving YM3 . . . 158
15.2.2 Security Guarantees for B upon receiving YM4 . . . 158
15.2.3 Towards proving secrecy of Nonce NB . . . 159
15.2.4 The Nonce NB uniquely identifies B's message. . . . 160
15.2.5 A nonce value is never used both as NA and as NB . . . 160
15.3 Authenticating B to A . . . 161
15.4 Authenticating A to B using the certificate `Crypt K (Nonce NB)` . 162

16 The Yahalom Protocol, Variant 2 **163**
16.1 Inductive Proofs . . . 164
16.2 Crucial Secrecy Property: Spy Does Not See Key `KAB` . . . 165
16.3 Security Guarantee for A upon receiving YM3 . . . 166
16.4 Security Guarantee for B upon receiving YM4 . . . 167
16.5 Authenticating B to A . . . 167
16.6 Authenticating A to B . . . 168

17 The Yahalom Protocol: A Flawed Version **169**
17.1 Regularity Lemmas for Yahalom . . . 170
17.2 For reasoning about the encrypted portion of messages . . . 170
17.3 Secrecy Theorems . . . 171
17.4 Session keys are not used to encrypt other session keys . . . 171
17.5 Security Guarantee for A upon receiving YM3 . . . 172
17.6 Security Guarantees for B upon receiving YM4 . . . 172
17.7 The Flaw in the Model . . . 172
17.8 Basic Lemmas . . . 175
17.9 About NRO: Validity for `B` . . . 176

17.10About NRR: Validity for `A` . . . 177
17.11Proofs About `sub_K` . . . 177
17.12Proofs About `con_K` . . . 178
17.13Proving fairness . . . 178

18 Verifying the Needham-Schroeder Public-Key Protocol 180

19 Verifying the Needham-Schroeder-Lowe Public-Key Protocol 183
19.1 Authenticity properties obtained from NS2 . . . 184
19.2 Authenticity properties obtained from NS2 . . . 184
19.3 Overall guarantee for B . . . 185

20 The TLS Protocol: Transport Layer Security 185
20.1 Protocol Proofs . . . 190
20.2 Inductive proofs about tls . . . 191
20.2.1 Properties of items found in Notes . . . 191
20.2.2 Protocol goal: if B receives CertVerify, then A sent it . . . 192
20.2.3 Unicity results for PMS, the pre-master-secret . . . 192
20.3 Secrecy Theorems . . . 193
20.3.1 Protocol goal: serverK(Na,Nb,M) and clientK(Na,Nb,M) remain secure . . . 194
20.3.2 Weakening the Oops conditions for leakage of clientK . . . 195
20.3.3 Weakening the Oops conditions for leakage of serverK . . . 195
20.3.4 Protocol goals: if A receives ServerFinished, then B is present and has used the quoted values PA, PB, etc. Note that it is up to A to compare PA with what she originally sent. . . . 195
20.3.5 Protocol goal: if B receives any message encrypted with clientK then A has sent it . . . 196
20.3.6 Protocol goal: if B receives ClientFinished, and if B is able to check a CertVerify from A, then A has used the quoted values PA, PB, etc. Even this one requires A to be uncompromised. . . . 196

21 The Certified Electronic Mail Protocol by Abadi et al. 197
21.1 Proving Confidentiality Results . . . 200
21.2 The Guarantees for Sender and Recipient . . . 202

22 Theory of Events for Security Protocols that use smartcards 203
22.1 Function `knows` . . . 205
22.2 Knowledge of Agents . . . 207

23 Theory of smartcards 210
23.1 Basic properties of shrK . . . 212
23.2 Function "knows" . . . 212
23.3 Fresh nonces . . . 214
23.4 Supply fresh nonces for possibility theorems. . . . 214
23.5 Specialized Rewriting for Theorems About `analz` and Image . . . 214
23.6 Tactics for possibility theorems . . . 215

24 Original Shoup-Rubin protocol 216

25 Bella's modification of the Shoup-Rubin protocol **234**

26 Extensions to Standard Theories **253**
26.1 Extensions to Theory *Set* . . . 253
26.2 Extensions to Theory *List* . . . 253
26.2.1 "remove l x" erase the first element of "l" equal to "x" . . . 253
26.3 Extensions to Theory *Message* . . . 254
26.3.1 declarations for tactics . . . 254
26.3.2 extract the agent number of an Agent message . . . 254
26.3.3 messages that are pairs . . . 254
26.3.4 well-foundedness of messages . . . 255
26.3.5 lemmas on keysFor . . . 255
26.3.6 lemmas on parts . . . 255
26.3.7 lemmas on synth . . . 256
26.3.8 lemmas on analz . . . 256
26.3.9 lemmas on parts, synth and analz . . . 256
26.3.10 greatest nonce used in a message . . . 257
26.3.11 sets of keys . . . 257
26.3.12 keys a priori necessary for decrypting the messages of G . . . 257
26.3.13 only the keys necessary for G are useful in analz . . . 258
26.4 Extensions to Theory *Event* . . . 258
26.4.1 general protocol properties . . . 258
26.4.2 lemma on knows . . . 259
26.4.3 knows without initState . . . 259
26.4.4 decomposition of knows into knows' and initState . . . 259
26.4.5 knows' is finite . . . 260
26.4.6 monotonicity of knows . . . 260
26.4.7 maximum knowledge an agent can have includes messages sent to the agent . . . 260
26.4.8 basic facts about *knows_max* . . . 261
26.4.9 used without initState . . . 261
26.4.10 monotonicity of used . . . 262
26.4.11 lemmas on used and knows . . . 263
26.4.12 a nonce or key in a message cannot equal a fresh nonce or key . . . 263
26.4.13 message of an event . . . 263

27 Decomposition of Analz into two parts **264**
27.1 messages that do not contribute to analz . . . 264
27.2 basic facts about *pparts* . . . 264
27.3 facts about *pparts* and *parts* . . . 265
27.4 facts about *pparts* and *analz* . . . 266
27.5 messages that contribute to analz . . . 266
27.6 basic facts about *kparts* . . . 266
27.7 facts about *kparts* and *parts* . . . 267
27.8 facts about *kparts* and *analz* . . . 268
27.9 analz is pparts + analz of kparts . . . 268

28 Protocol-Independent Confidentiality Theorem on Nonces 268
28.1 basic facts about *guard* . . . 269
28.2 guarded sets . . . 270
28.3 basic facts about *Guard* . . . 270
28.4 set obtained by decrypting a message . . . 271
28.5 number of Crypt's in a message . . . 271
28.6 basic facts about *crypt_nb* . . . 272
28.7 number of Crypt's in a message list . . . 272
28.8 basic facts about *cnb* . . . 272
28.9 list of kparts . . . 272
28.10 list corresponding to "decrypt" . . . 272
28.11 basic facts about *decrypt'* . . . 272
28.12 if the analyse of a finite guarded set gives n then it must also gives one of the keys of Ks . . . 273
28.13 if the analyse of a finite guarded set and a (possibly infinite) set of keys gives n then it must also gives Ks . . . 273
28.14 Extensions to Theory *Public* . . . 273
28.14.1 signature . . . 273
28.14.2 agent associated to a key . . . 273
28.14.3 basic facts about *initState* . . . 274
28.14.4 sets of private keys . . . 274
28.14.5 sets of good keys . . . 274
28.14.6 greatest nonce used in a trace, 0 if there is no nonce . . . 274
28.14.7 function giving a new nonce . . . 275
28.15 Proofs About Guarded Messages . . . 275
28.15.1 small hack necessary because priK is defined as the inverse of pubK . . . 275
28.15.2 guardedness results . . . 275
28.15.3 regular protocols . . . 276

29 Lists of Messages and Lists of Agents 276
29.1 Implementation of Lists by Messages . . . 276
29.1.1 nil is represented by any message which is not a pair . . . 276
29.1.2 induction principle . . . 276
29.1.3 head . . . 276
29.1.4 tail . . . 276
29.1.5 length . . . 277
29.1.6 membership . . . 277
29.1.7 delete an element . . . 277
29.1.8 concatenation . . . 277
29.1.9 replacement . . . 277
29.1.10 ith element . . . 277
29.1.11 insertion . . . 278
29.1.12 truncation . . . 278
29.2 Agent Lists . . . 278
29.2.1 set of well-formed agent-list messages . . . 278
29.2.2 basic facts about agent lists . . . 278

30 Protocol P1 **279**
30.1 Protocol Definition . . . 279
30.1.1 offer chaining: B chains his offer for A with the head offer of L for sending it to C . . . 279
30.1.2 agent whose key is used to sign an offer . . . 279
30.1.3 nonce used in an offer . . . 280
30.1.4 next shop . . . 280
30.1.5 anchor of the offer list . . . 280
30.1.6 request event . . . 280
30.1.7 propose event . . . 281
30.1.8 protocol . . . 281
30.1.9 Composition of Traces . . . 281
30.1.10 Valid Offer Lists . . . 282
30.1.11 basic properties of valid . . . 282
30.1.12 offers of an offer list . . . 282
30.1.13 the originator can get the offers . . . 282
30.1.14 list of offers . . . 282
30.1.15 list of agents whose keys are used to sign a list of offers . 282
30.1.16 builds a trace from an itinerary . . . 282
30.1.17 there is a trace in which the originator receives a valid answer . . . 283
30.2 properties of protocol P1 . . . 283
30.2.1 strong forward integrity: except the last one, no offer can be modified . . . 283
30.2.2 insertion resilience: except at the beginning, no offer can be inserted . . . 283
30.2.3 truncation resilience: only shop i can truncate at offer i . 284
30.2.4 declarations for tactics . . . 284
30.2.5 get components of a message . . . 284
30.2.6 general properties of p1 . . . 284
30.2.7 private keys are safe . . . 285
30.2.8 general guardedness properties . . . 285
30.2.9 guardedness of messages . . . 285
30.2.10 Nonce uniqueness . . . 286
30.2.11 requests are guarded . . . 286
30.2.12 propositions are guarded . . . 286
30.2.13 data confidentiality: no one other than the originator can decrypt the offers . . . 286
30.2.14 non repudiability: an offer signed by B has been sent by B 287

31 Protocol P2 **287**
31.1 Protocol Definition . . . 287
31.1.1 offer chaining: B chains his offer for A with the head offer of L for sending it to C . . . 287
31.1.2 agent whose key is used to sign an offer . . . 288
31.1.3 nonce used in an offer . . . 288
31.1.4 next shop . . . 288
31.1.5 anchor of the offer list . . . 288
31.1.6 request event . . . 289
31.1.7 propose event . . . 289

31.1.8 protocol . . . 289
31.1.9 valid offer lists . . . 290
31.1.10 basic properties of valid . . . 290
31.1.11 list of offers . . . 290
31.2 Properties of Protocol P2 . . . 290
31.3 strong forward integrity: except the last one, no offer can be modified . . . 290
31.4 insertion resilience: except at the beginning, no offer can be inserted 290
31.5 truncation resilience: only shop i can truncate at offer i . . . 291
31.6 declarations for tactics . . . 291
31.7 get components of a message . . . 291
31.8 general properties of p2 . . . 291
31.9 private keys are safe . . . 292
31.10 general guardedness properties . . . 292
31.11 guardedness of messages . . . 292
31.12 Nonce uniqueness . . . 293
31.13 requests are guarded . . . 293
31.14 propositions are guarded . . . 293
31.15 data confidentiality: no one other than the originator can decrypt the offers . . . 294
31.16 forward privacy: only the originator can know the identity of the shops . . . 294
31.17 non repudiability: an offer signed by B has been sent by B . . . 294

32 Needham-Schroeder-Lowe Public-Key Protocol 295
32.1 messages used in the protocol . . . 295
32.2 definition of the protocol . . . 295
32.3 declarations for tactics . . . 296
32.4 general properties of nsp . . . 296
32.5 nonce are used only once . . . 296
32.6 guardedness of NA . . . 297
32.7 guardedness of NB . . . 297
32.8 Agents' Authentication . . . 297

33 protocol-independent confidentiality theorem on keys 297
33.1 basic facts about *guardK* . . . 298
33.2 guarded sets . . . 298
33.3 basic facts about *GuardK* . . . 299
33.4 set obtained by decrypting a message . . . 300
33.5 number of Crypt's in a message . . . 300
33.6 basic facts about *crypt_nb* . . . 300
33.7 number of Crypt's in a message list . . . 300
33.8 basic facts about *cnb* . . . 300
33.9 list of kparts . . . 301
33.10 list corresponding to "decrypt" . . . 301
33.11 basic facts about *decrypt'* . . . 301
33.12 Basic properties of shrK . . . 302
33.13 Function "knows" . . . 303
33.14 Fresh nonces . . . 303
33.15 Supply fresh nonces for possibility theorems. . . . 303

33.16Specialized Rewriting for Theorems About `analz` and Image . . . 304
33.17Tactics for possibility theorems . . . 304

34 lemmas on guarded messages for protocols with symmetric keys 305
34.1 Extensions to Theory `Shared` . . . 305
34.1.1 a little abbreviation . . . 305
34.1.2 agent associated to a key . . . 305
34.1.3 basic facts about `initState` . . . 305
34.1.4 sets of symmetric keys . . . 306
34.1.5 sets of good keys . . . 306
34.2 Proofs About Guarded Messages . . . 306
34.2.1 small hack . . . 306
34.2.2 guardedness results on nonces . . . 306
34.2.3 guardedness results on keys . . . 307
34.2.4 regular protocols . . . 307

35 Otway-Rees Protocol 308
35.1 messages used in the protocol . . . 308
35.2 definition of the protocol . . . 309
35.3 declarations for tactics . . . 309
35.4 general properties of or . . . 309
35.5 or is regular . . . 310
35.6 guardedness of KAB . . . 310
35.7 guardedness of NB . . . 310

36 Yahalom Protocol 310
36.1 messages used in the protocol . . . 310
36.2 definition of the protocol . . . 311
36.3 declarations for tactics . . . 311
36.4 general properties of ya . . . 312
36.5 guardedness of KAB . . . 312
36.6 session keys are not symmetric keys . . . 312
36.7 ya2' implies ya1' . . . 312
36.8 uniqueness of NB . . . 312
36.9 ya3' implies ya2' . . . 313
36.10ya3' implies ya3 . . . 313

1 Theory of Agents and Messages for Security Protocols

theory *Message* **imports** *Main* **begin**

lemma *[simp] : "A ∪ (B ∪ A) = B ∪ A"*
⟨*proof*⟩

types
key = nat

consts
all_symmetric :: bool — true if all keys are symmetric
invKey :: "key=>key" — inverse of a symmetric key

specification *(invKey)*
invKey [simp]: "invKey (invKey K) = K"
invKey_symmetric: "all_symmetric --> invKey = id"
⟨*proof*⟩

The inverse of a symmetric key is itself; that of a public key is the private key and vice versa

constdefs
symKeys :: "key set"
"symKeys == {K. invKey K = K}"

datatype — We allow any number of friendly agents
agent = Server | Friend nat | Spy

datatype
msg = Agent agent — Agent names
| Number nat — Ordinary integers, timestamps, ...
| Nonce nat — Unguessable nonces
| Key key — Crypto keys
| Hash msg — Hashing
| MPair msg msg — Compound messages
| Crypt key msg — Encryption, public- or shared-key

Concrete syntax: messages appear as —A,B,NA—, etc...

syntax
*"@MTuple" :: "['a, args] => 'a * 'b" ("(2{|_,/ _|})")*

syntax *(xsymbols)*
*"@MTuple" :: "['a, args] => 'a * 'b" ("(2⦃_,/ _⦄)")*

translations
"{|x, y, z|}" == "{|x, {|y, z|}|}"
"{|x, y|}" == "MPair x y"

constdefs
HPair :: "[msg,msg] => msg" *("(4Hash[_] /_)" [0, 1000])*

— Message Y paired with a MAC computed with the help of X
"Hash[X] Y == {| Hash{|X,Y|}, Y|}"

keysFor :: "msg set => key set"
— Keys useful to decrypt elements of a message set
"keysFor H == invKey ‘ {K. ∃X. Crypt K X ∈ H}"

Tells A that B was alive after she sent him the session key. The session key must be assumed confidential for this deduction to be meaningful, but that assumption can be relaxed by the appropriate argument.

Precisely, the theorem guarantees (to A) key distribution of the session key to B. It also guarantees (to A) non-injective agreement of B with A on the session key. Both goals are available to A in the sense of Goal Availability.

6.11 Parties authentication: each party verifies "the identity of another party who generated some data" (quoted from Neuman and Ts'o).

These guarantees don't assess whether two parties agree on the same session key: sending a message containing a key doesn't a priori state knowledge of the key.

8.10 Parties authentication: each party verifies "the identity of another party who generated some data" (quoted from Neuman and Ts'o).

8.12 Novel guarantees, never studied before. Because honest agents always say the right timestamp in authenticators, we can prove unicity guarantees based exactly on timestamps. Classical unicity guarantees are based on nonces. Of course assuming the agent to be different from the Spy, rather than not in bad, would suffice below. Similar guarantees must also hold of Kerberos IV.

Notice that an honest agent can send the same timestamp on two different traces of the same length, but not on the same trace!

10 The Otway-Rees Protocol as Modified by Abadi and Needham

theory *OtwayRees_AN* **imports** *Public* **begin**

This simplified version has minimal encryption and explicit messages.

Note that the formalization does not even assume that nonces are fresh. This is because the protocol does not rely on uniqueness of nonces for security, only for freshness, and the proof script does not prove freshness properties.

11 The Otway-Rees Protocol: The Faulty BAN Version

theory *OtwayRees_Bad* **imports** *Public* **begin**

The FAULTY version omitting encryption of Nonce NB, as suggested on page 247 of Burrows, Abadi and Needham (1988). A Logic of Authentication. Proc. Royal Soc. 426

This file illustrates the consequences of such errors. We can still prove impressive-looking properties such as *Spy_not_see_encrypted_key*, yet the protocol is open to a middleperson attack. Attempting to prove some key lemmas indicates the possibility of this attack.

12 Bella's version of the Otway-Rees protocol

theory *OtwayReesBella* **imports** *Public* **begin**

Bella's modifications to a version of the Otway-Rees protocol taken from the BAN paper only concern message 7. The updated protocol makes the goal of key distribution of the session key available to A. Investigating the principle of Goal Availability undermines the BAN claim about the original protocol, that "this protocol does not make use of Kab as an encryption key, so neither principal can know whether the key is known to the other". The updated protocol makes no use of the session key to encrypt but informs A that B knows it.

B knows, by the second part of A's message, that the Server distributed the key quoting nonce NB. This part says nothing about agent names. Secrecy of NB is crucial. Note that *Nonce NB ∉ analz (knows Spy evs)* must be the FIRST antecedent of the induction formula.

The Server message associates K with NB' and therefore not with any other nonce NB.

The only nonces that can be found with the help of session keys are those distributed as nonce NB by the Server. The form of the theorem recalls *analz_image_freshK*, but it is much more complicated.

As with *analz_image_freshK*, we take some pains to express the property as a logical equivalence so that the simplifier can apply it.

lemma *Nonce_secrecy_lemma:*

⟨*proof*⟩

B's session key guarantee from YM4. The two certificates contribute to a single conclusion about the Server's message. Note that the "Notes Spy" assumption must quantify over ∀ POSSIBLE keys instead of our particular K. If this run is broken and the spy substitutes a certificate containing an old key, B has no means of telling.

16 The Yahalom Protocol, Variant 2

theory *Yahalom2* **imports** *Public* **begin**

This version trades encryption of NB for additional explicitness in YM3. Also in YM3, care is taken to make the two certificates distinct.

This theory has the prototypical example of a secrecy relation, KeyCryptNonce.

16.6 Authenticating A to B

using the certificate *Crypt K (Nonce NB)*

Assuming the session key is secure, if both certificates are present then A has said NB. We can't be sure about the rest of A's message, but only NB matters for freshness. Note that *Key K ∉ analz (knows Spy evs)* must be the FIRST antecedent of the induction formula.

17.7 The Flaw in the Model

Up to now, the reasoning is similar to standard Yahalom. Now the doubtful reasoning occurs. We should not be assuming that an unknown key is secure, but the model allows us to: there is no Oops rule to let session keys become compromised.

B knows, by the second part of A's message, that the Server distributed the key quoting nonce NB. This part says nothing about agent names. Secrecy of K is assumed; the valid Yahalom proof uses (and later proves) the secrecy of NB.

17.13 Proving fairness

Cannot prove that, if *B* has NRO, then *A* has her NRR. It would appear that *B* has a small advantage, though it is useless to win disputes: *B* needs to present *con_K* as well.

Strange: unicity of the label protects *A*?

lemma *A_unicity:*
```
"[|NRO = Crypt (priK A) {|Number f_nro, Agent B, Nonce L, Crypt K M|};
```

```
        NRO ∈ parts (spies evs);
        Says A B {|Number f_nro, Agent B, Nonce L, Crypt K M', NRO'|}
          ∈ set evs;
        A ∉ bad; evs ∈ zg |]
     ==> M'=M"
```
⟨*proof*⟩

Fairness lemma: if *sub_K* exists, then *A* holds NRR. Relies on unicity of labels.

lemma *sub_K_implies_NRR:*
```
     "[| NRO = Crypt (priK A) {|Number f_nro, Agent B, Nonce L, Crypt K M|};
         NRR = Crypt (priK B) {|Number f_nrr, Agent A, Nonce L, Crypt K M|};
         sub_K ∈ parts (spies evs);
         NRO ∈ parts (spies evs);
         sub_K = Crypt (priK A) {|Number f_sub, Agent B, Nonce L, Key K|};
         A ∉ bad;  evs ∈ zg |]
     ==> Gets A {|Number f_nrr, Agent A, Nonce L, NRR|} ∈ set evs"
```
⟨*proof*⟩

lemma *Crypt_used_imp_L_used:*
```
     "[| Crypt (priK TTP) {|F, A, B, L, K|} ∈ used evs; evs ∈ zg |]
      ==> L ∈ used evs"
```
⟨*proof*⟩

Fairness for *A*: if *con_K* and *NRO* exist, then *A* holds NRR. *A* must be uncompromised, but there is no assumption about *B*.

theorem *A_fairness_NRO:*
```
     "[|con_K ∈ used evs;
        NRO ∈ parts (spies evs);
        con_K = Crypt (priK TTP)
                      {|Number f_con, Agent A, Agent B, Nonce L, Key K|};
        NRO = Crypt (priK A) {|Number f_nro, Agent B, Nonce L, Crypt K M|};
        NRR = Crypt (priK B) {|Number f_nrr, Agent A, Nonce L, Crypt K M|};
        A ∉ bad;  evs ∈ zg |]
    ==> Gets A {|Number f_nrr, Agent A, Nonce L, NRR|} ∈ set evs"
```
⟨*proof*⟩

Fairness for *B*: NRR exists at all, then *B* holds NRO. *B* must be uncompromised, but there is no assumption about *A*.

theorem *B_fairness_NRR:*
```
     "[|NRR ∈ used evs;
        NRR = Crypt (priK B) {|Number f_nrr, Agent A, Nonce L, C|};
        NRO = Crypt (priK A) {|Number f_nro, Agent B, Nonce L, C|};
        B ∉ bad; evs ∈ zg |]
    ==> Gets B {|Number f_nro, Agent B, Nonce L, C, NRO|} ∈ set evs"
```
⟨*proof*⟩

If *con_K* exists at all, then *B* can get it, by *con_K_validity*. Cannot conclude that also NRO is available to *B*, because if *A* were unfair, *A* could build message 3 without building message 1, which contains NRO.

20.3.1 Protocol goal: serverK(Na,Nb,M) and clientK(Na,Nb,M) remain secure

⟨*proof*⟩

20.3.4 Protocol goals: if A receives ServerFinished, then B is present and has used the quoted values PA, PB, etc. Note that it is up to A to compare PA with what she originally sent.

The mention of her name (A) in X assures A that B knows who she is.

lemma *TrustServerFinished [rule_format]:*

```
"[| X = Crypt (serverK(Na,Nb,M))

         Notes A {|Agent B, Nonce PMS|} ∈ set evs -->
         X ∈ parts (spies evs) --> Says B A X ∈ set evs"
```

⟨*proof*⟩

This version refers not to ServerFinished but to any message from B. We don't assume B has received CertVerify, and an intruder could have changed A's identity in all other messages, so we can't be sure that B sends his message to A. If CLIENT KEY EXCHANGE were augmented to bind A's identity with PMS, then we could replace A' by A below.

lemma *TrustServerMsg [rule_format]:*

          (∃A'. Says B A' (Crypt (serverK(Na,Nb,M)) Y) ∈ set evs)"
```

⟨*proof*⟩

20.3.5 Protocol goal: if B receives any message encrypted with clientK then A has sent it

ASSUMING that A chose PMS. Authentication is assumed here; B cannot verify it. But if the message is ClientFinished, then B can then check the quoted values PA, PB, etc.

As smartcards handle long-term (symmetric) keys, this theoy extends and supersedes theory Private.thy

An agent is bad if she reveals her PIN to the spy, not the shared key that is embedded in her card. An agent's being bad implies nothing about her smartcard, which independently may be stolen or cloned.

lemma *Nonce_supply: "Nonce (@ N. Nonce N ∉ used evs) ∉ used evs"*
⟨*proof*⟩

Unlike the corresponding property of nonces, we cannot prove *finite KK ⟹ ∃K. K ∉ KK ∧ Key K ∉ used evs*. We have infinitely many agents and there is nothing to stop their long-term keys from exhausting all the natural numbers. Instead, possibility theorems must assume the existence of a few keys.

25 Bella's modification of the Shoup-Rubin protocol

theory *ShoupRubinBella* **imports** *Smartcard* **begin**

The modifications are that message 7 now mentions A, while message 10 now mentions Nb and B. The lack of explicitness of the original version was discovered by investigating adherence to the principle of Goal Availability. Only the updated version makes the goals of confidentiality, authentication and key distribution available to both peers.
